Q: Solr Search with multiple query parameters I am trying to use the Solr Query Console to search for product data on a website. I am getting an error saying the parameters should be separated with the equals sign. I am currently trying to search for product data using this query: q=id:\*1\*" and type:"cat" and size:"small" I then get the error: Parameters should be separated with a comma or equals sign. Does anyone know how I can combine these search parameters into one query? A: you can simply use the \* wildcard and it will return all documents that contain a field with any value of your query. If you use \* and add the d to the front of the q query it will return all documents that match the query. For your query that would be q=d:\*1 and d=\*:cat and d=\*:small. Veno-arterial extracorporeal life support as a bridge to lung transplantation in neonatal pulmonary hypertension. Neonatal pulmonary hypertension is a progressive and challenging clinical problem that can ultimately lead to death or lung transplantation. While more options for treatment are available for older patients, there are no clear guidelines on optimal management for neonatal pulmonary hypertension. Treatment with a veno-arterial extracorporeal life support (VA-ECLS) can provide long-term circulatory support in patients with cardiorespiratory failure, including those with severe pulmonary hypertension. A VA-ECLS was initiated in a neonate with severe pulmonary hypertension and hydrops fetalis (pulmonary artery pressure 76 mmHg) who failed to improve with a variety of medical and surgical therapies. The VA-ECLS provided a stable circulation with mild increases in the pulmonary artery pressure. However, an inappropriate increase in the mean pulmonary artery pressure during systemic venous venting led to a termination of the extracorporeal life support. After transplantation of the right lung, the right ventricular function recovered within 1 year. This report demonstrates the feasibility and safety of long-term VA-ECLS as a bridge to lung transplantation in a neonate with severe pulmonary hypertension.Q: How to compile a sh script with scons, but without executing the command in the command line? I am working with an SConscript and i 82157476af
